NexaTech

FULL STACK DEVELOPMENT PROJECT 1 FRONTEND DOCUMENTATION

Responsive Company Website & Admin Interface

Technology: React.js • CSS • JavaScript • React Icons

Batch: 2026

1. Introduction

Project 1 is the frontend phase of the NexaTech full-stack application. The project focuses on building a clean, responsive and user-friendly company website together with a frontend admin interface. The public website presents the company, its services and contact information, while the admin interface provides a dashboard-style view for managing contact information.

2. Project Objectives

- Build a modern responsive frontend using React.js.
- Create reusable React components for the website sections and navigation.
- Provide clear Home, About, Services and Contact sections.
- Create a dedicated admin login and dashboard interface.
- Provide a responsive sidebar for the admin panel.
- Create a contact form interface that can be connected to backend APIs.
- Maintain a consistent dark theme with blue/purple accent colors.
- Organize the project into components, pages and utility files for maintainability.

3. Technologies Used

Technology	Purpose	Usage in Project
React.js	Frontend framework	Components, pages and application UI
JavaScript	Application logic	State, events, form handling and navigation
CSS	UI styling	Responsive layouts, colors, spacing and animations
React Icons	UI icons	Contact and admin interface icons
Vite / React tooling	Development environment	Local development and frontend build

4. Frontend Project Structure

The frontend is organized into reusable components, page-level components and utility files. This structure keeps the public website and admin interface separated and easier to maintain.

5. Public Website Interface

The public-facing NexaTech website uses a dark professional theme and a consistent navigation bar. The main navigation provides quick access to Home, About, Services and Contact sections.

5.1 Home Page

The Home page acts as the main landing section. It introduces NexaTech through a strong hero heading, supporting description and call-to-action buttons. A technology-themed illustration is displayed on the right.

Figure 1. NexaTech Home page / hero section.

5.2 About Section

The About section explains the purpose of NexaTech and presents project, client and experience statistics. The two-column layout combines an illustration with descriptive content and a Read More action.

Figure 2. About NexaTech section.

5.3 Services Section

The Services section presents the main digital services in visually separated cards. The provided interface includes Web Development, UI/UX Design and Cloud Solutions.

Figure 3. Services section with responsive service cards.

5.4 Contact Section

The Contact section is divided into two areas. The left side contains company contact details, while the right side provides a form for name, email and message input. The form is designed to send contact information to the application backend.

Figure 4. Contact section with information cards and contact form.

6. Admin Interface

The frontend also contains an administrative interface. The admin area uses a dark dashboard layout with a fixed sidebar and separate sections for Dashboard, Contacts and Settings. A logout control is available at the bottom of the sidebar.

6.1 Admin Login

The login screen provides a centered authentication form containing username and password fields and a Login button. It provides the entry point to the admin interface.

Figure5.NexaTech Admin login screen.

6.2 Admin Dashboard

The dashboard provides a summary of the administrative system. The interface displays total contacts, search results, admin status and database status, followed by a contact-management call-to-action.

7. Frontend Functionality

- Component-based UI using React functional components.
- Navigation between public website sections.
- Controlled contact form inputs using React state.
- Form validation for name, email and message fields.
- Loading state during contact form submission.
- Edit/update mode for an existing selected contact in the contact form.
- Responsive admin sidebar with a compact mobile width.
- Reusable styling through dedicated CSS files.
- Admin dashboard cards for contact and system status information.

8. Contact Form Flow

The Contact component maintains form data in React state. When the user submits the form, the frontend validates the fields and sends an HTTP request to the backend. A POST request is used for a new contact, while a PUT request is used when an existing contact is selected for update. The UI displays a loading state during the request and clears the form after a successful response.

9. Responsive Design

Responsive CSS rules are used to adapt the interface to smaller screens. In particular, the admin sidebar reduces from a full-width navigation panel to a compact icon-based sidebar on smaller viewport widths. This allows the main content area to remain usable on mobile devices.

10. Visual Design

- Dark navy background for a professional technology-oriented appearance.
- Blue and purple gradient accents for branding and call-to-action elements.
- Rounded cards and borders for clear content grouping.
- High-contrast typography for headings and important values.
- Consistent spacing and alignment across sections.
- Icon-based visual cues for contact information and admin navigation.

11. Conclusion

Project 1 establishes the frontend foundation of the NexaTech full-stack application. It demonstrates the use of React components, state management, form handling, responsive CSS, navigation and dashboard-oriented UI design. The resulting interface provides both a polished public company website and a structured admin frontend ready to communicate with the backend.

12. Project 1 Deliverable

Item	Status
React frontend	Completed
Home / About / Services / Contact UI	Completed
Admin login UI	Completed
Admin dashboard UI	Completed
Responsive admin sidebar	Completed
Contact form UI and validation	Completed
Frontend documentation with screenshots	Completed
